YEARLY TRAFFIC VOLUME REPORT

1988

INTRODUCTION

This is the twentieth annual Traffic Volume Report presented in conjunction with the traffic counting program conducted by the Traffic Services Division of the City of Halifax.

Measurements of traffic volumes are the most basic of all traffic studies. Traffic volumes are gathered in order to determine the number of vehicles travelling on a roadway or through an area, to evaluate accident data, to serve as a basis for roadway classifications, to plan for route location and geometric design as well as determine trends, etc.

The information contained in this report is a condensed summary of traffic volume data collected during 1988. Included in the report are 24 hour volumes, peak hour intersection volumes, cordon counts, and yearly comparisons.

This report is compiled not only for use by City staff and City Council, but to be utilized by other groups such as consultants, planners, and interested members of the public as well.

Prepared by: V. Perrin, Traffic Analyst

Approved by: B. N. Kennedy, Traffic Services Supervisor

VP/kz

DEFINITIONS

The following definitions are presented as an aid to those not familiar with the terminology used in this report.

A.A.W.T.	-	Average Annual Weekday Traffic
C.B.D.	-	Central Business District
C.B.D. Cordon	-	That area designated by the City of Halifax that encompasses the Central Business District.
City Limit Cordon	-	Those points on City exits and entrances where City jurisdiction ends.
Peninsula Cordon	-	That area of the City included within the boundaries of Bedford Basin, the Narrows, the North West Arm, Dutch Village Road and Joseph Howe Drive.

NOTATION

1 - Way - Vehicular count for one-way direction.

2 - Way - Vehicular count for two-way direction.

NB/, S/B, E/B, W/B - Direction of travel, i.e., N/B means northbound.

N/A - Not available.

FACTORS IN TRAFFIC COUNTING

AXLE FACTORS

Twenty-four hour volume counts collected during the year were obtained from portable automatic traffic counters placed on various sections of City streets. These automatic counters respond to air impulses produced as vehicles pass over a hollow rubber tube extended across the roadway. Every two pulses are recorded as one vehicle. Thus all vehicles having more than two axles are recorded as more than one vehicle. To improve on the accuracy of the mechanical counts due to this fact, and to determine a daily average, an axle factor was derived. This factor was determined in 1972 (reconfirmed in 1979) from continuous 11 hour manual vehicular classification counts done on various major routes in the peninsula and mainland areas.

The axle factor is 0.986.

TRAFFIC FACTORS

Traffic volumes vary from season to season as well as from day to day. Therefore, a traffic count obtained at a specific location during a specific time frame may or may not represent the average annual weekday traffic (A.A.W.T.) volume for that particular section of roadway. To compensate for this daily and seasonal variation, A.A.W.T. factors are applied to the raw volume data; these factors have been calculated from daily volumes collected on the Angus L. Macdonald and A. Murray MacKay Bridges for the past ten years. The A.A.W.T. factors are:

	Monday	Tuesday	Wednesday	Thursday	Friday
January	1.13	1.12	1.12	1.07	1.02
February	1.13	1.11	1.12	1.05	.99
March	1.08	1.07	1.06	1.00	.96
April	1.06	1.03	1.03	.97	.92
May	1.03	1.02	1.01	.97	.92
June	1.01	.99	.99	.95	.91
July	1.04	1.01	1.01	.98	.95
August	1.02	1.02	1.01	.98	.95
September	.99	.99	.99	.95	.91
October	1.00	1.00	.99	.95	.89
November	1.01	1.00	1.00	.96	.90
December	1.01	1.00	.99	.96	.90

COMPREHENSIVE 3 YEAR A.A.W.T. SUMMARY

All major streets in Halifax are counted on a yearly basis. The following table, pages (to summarizes the volume of each major section of roadway over the past three years. For compar purposes the yearly percentage change in volume is also noted.

In addition to the regular counting program, various traffic studies often necessitate that c be completed on other streets as well. These additional volumes are listed on pages (to All volumes are 2-way unless direction of travel is noted (e.g. S/B, N/B, W/B or E/B).

Macdonald	- Friday, 28 October 1988	- 47,285
MacKay	- Friday, 30 June 1988	- 60,308
Both Bridges	- Friday, 30 June 1988	- 107,492
Previous Record	- Friday, 23 October 1987	- 107,881

CORDON COUNTS

Cordon lines have been drawn around the City And areas within, thus dividing it into three (3) main parts, namely the City as a whole, the peninsula area and the central business district (C.B.D.) located in the downtown core. Volume counts collected on the major roadways crossing these cordon boundaries provide information related to trend statistics, design and parking requirements, etc. The volumes as well as percentage changes are indicated on the following three (3) tables.

INTERSECTION VOLUME COUNTS

1988 PEAK HOURS (8:00 A.M. - 9:00 A.M.) (4:20 P.M. - 5:20 P.M.)

Two manual peak hour turning movement counts were completed by temporary field workers (summer students) at each intersection during the summer months. These peak hour vehicular counts provide the necessary data for traffic signal timings and determining intersection design and control requirements.

The following list indicates those intersections having the highest peak hour volumes (a.m. peaks are shown in parentheses).

NO.	INTERSECTION	VOLUME 88	RATING 87	86	85
